The decision behind the headline.

Operations is where strategy meets the real world: time, capacity, people, suppliers, quality, and cost. Here is how this week's events connect to management concepts.

THIS WEEK'S LEARNING THEME

Operational Resilience

An organization's ability to sustain or restore critical operations when demand, supply, infrastructure, or processes are disrupted.

One concept. Connected thinking.

Use this map to move from definition to causes, consequences, and possible interventions.

THE CORE CONCEPT

Operational Resilience

An organization's ability to sustain or restore critical operations when demand, supply, infrastructure, or processes are disrupted.

CAUSES

- Dependence on a small number of suppliers or routes
- Demand uncertainty and limited visibility
- Capacity constraints and process bottlenecks
- Insufficient contingency planning

CONSEQUENCES

- Longer lead times and missed service targets
- Higher expediting and operating costs
- Production interruptions or stockouts
- Reduced customer trust

INTERVENTIONS

- Map critical suppliers, routes, and process dependencies
- Track lead time, service level, and bottleneck utilization
- Define contingency plans for high-impact disruptions
- Review trade-offs using evidence and scenario planning

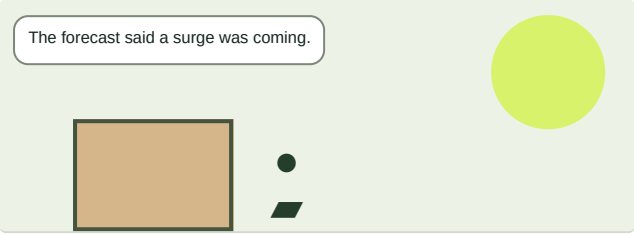

NEWS CONNECTION
Use the linked stories in this edition to ask how organizations protect flow, service, and cost performance under changing conditions.

TAKEAWAY: Resilience is designed through visibility, contingency choices, and disciplined measurement.

Concept maps simplify complex systems for learning. Actual management decisions require case-specific evidence.

Operations is serious. Managers are human.

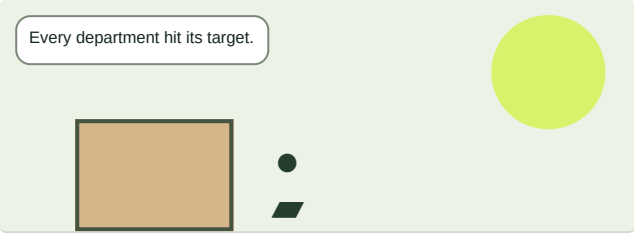

Three familiar moments from the world of processes, planning, and procurement.

FORECASTING

The forecast said a surge was coming. The warehouse is now fully stocked for a demand spike that exists only in the spreadsheet.

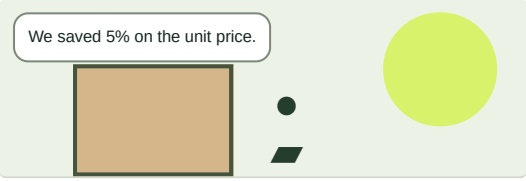

Lesson: forecasts are inputs to decisions, not facts.

BOTTLENECKS

Every department hit its target. The customer is still waiting because the slowest step never changed.

Lesson: optimize the whole flow, not every silo.

PROCUREMENT

We saved 5% on the unit price. Then paid 20% more for urgent freight.

Lesson: purchase price is not total cost.

THE WEEKLY TAKEAWAY

Fix the system, not just the symptom.

Before asking people to work harder, examine the process, constraints, incentives, information, and feedback loops shaping their decisions.

THE 30-SECOND OPS QUIZ

A warehouse has excess stock of slow-moving products but keeps running out of its bestsellers. Which topic would you investigate first?

A. Inventory classification and demand forecasting **B.** Office seating **C.** Logo design

Answer: A. Investigate demand patterns, replenishment rules, lead times, and inventory segmentation.

Cartoons in this edition are original illustrative scenarios, not claims about specific companies.
